# Bridging The Gap: From Science To Data Science

#### DEEPAK MAHTANI (@MAHTANI89) DATA SCIENTIST AND COMMUNITY MANAGER #DS\_TALK

#### This is about you

### Have you met Deepak?

Undergraduate – University of Sheffield (Mathematics and Astronomy)

PhD – Keele University (Astrophysics- Exoplanets atmospheres)

S2DS March 2016

Insight Analyst – Inspired Entertainment Inc.

Now – Data Scientist and Community Manager at Pivigo

#### The Age of Data

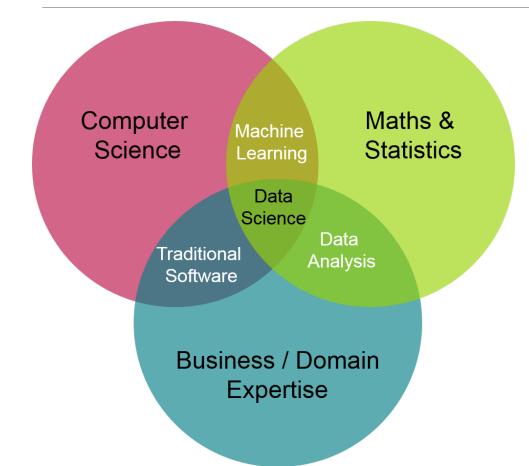

## Why should you be interested?

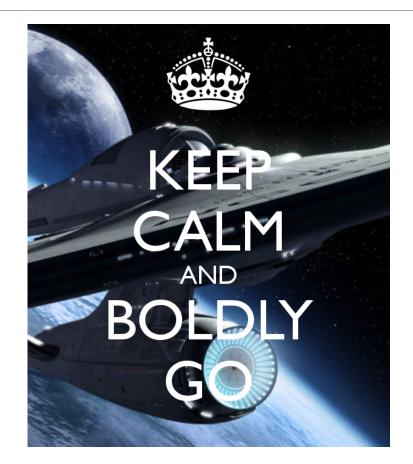

- Easy career transition
- Huge demand for people over the coming decade
- Salaries are high
- Exciting, vibrant atmosphere
- Understand how your own data is being used
- Tools and techniques can be useful in your science work etc. etc.

#### What is Data Science?

#### What is a data scientist?

Data Scientist (n.): Person who is better at statistics than any software engineer and better at software engineering than any statistician.

#### Why I chose data science

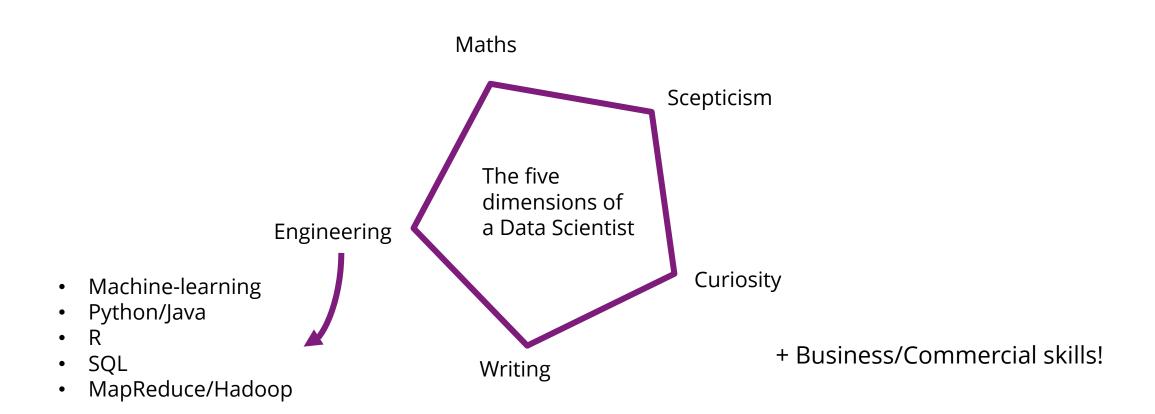

#### How to Become a Data Scientist?

#### What skills are needed?

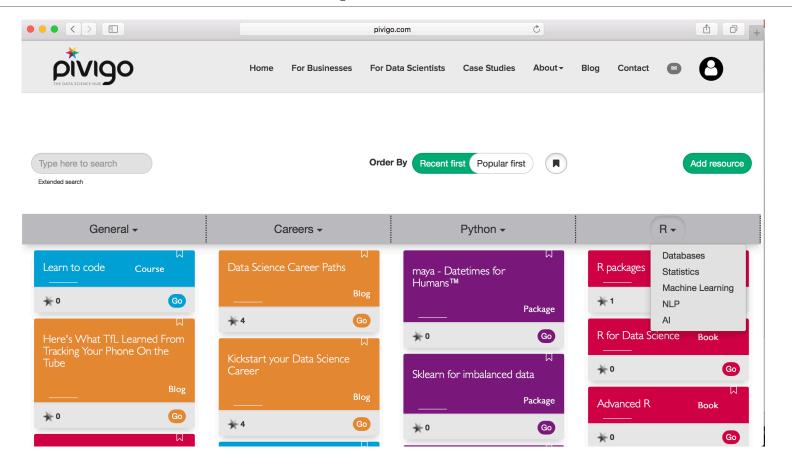

# Who are we?

**Up-Skill** 

## Science to Data Science

Science to Data Science

- 5 week programme
- Work in teams of 3 4 on real data science projects
- Partner with a company on a real project
- Get recruited into a data science role!

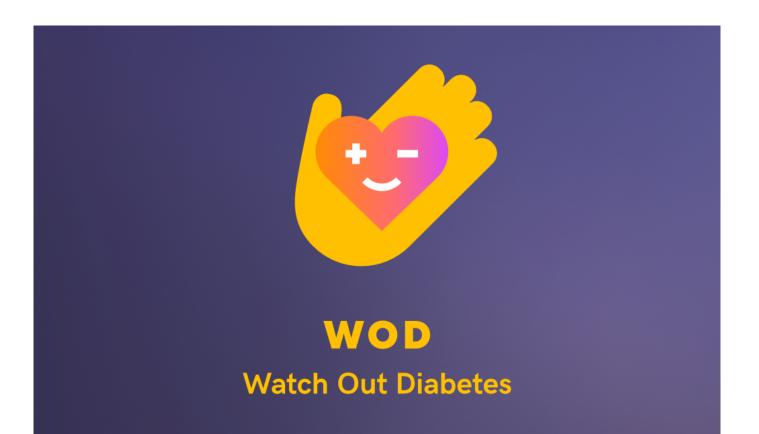

#### Science to Data Science (S2DS)

#### Example: Watchout Diabetes

#### Example: Row Analytics

#### The Marketplace: Data Science on Demand

Smart Pages for social giving Just Giving         Social giving is about raising awareness and donating to good causes. Data Science can help understand the height of willingness to give. The next step in using data in social giving is understanding a) which images should be recommended that will influence a network of potential donors, o) when to update the network with key information. This project will help good causes increase awareness, spread the good message and raise more donations; a challenging project, an innovative project, a unique project, the one project that matters for all good causes.         Posted: 2017-01-19       Location: London         Starts: 2017-02-20       Ret: up to 250 GBP per day (depending on experience)         Cost       To a start with the start of the start will prove the start with the start will prove the start with start with the start with the start with th

Capoo Banks typically contain large numbers of data sources, often with overlaps in where data is mastered and modified. Typically this results in data quality problems which lead to numerous issues from incorrect regulatory reporting, invalid risk assessments, through to the inability to provide or enhance products and services. To date, banks have dealt with these issues using traditional data modelling tools/approaches coupled with periodic data cleanup exercises. Our PoC centres on automated analysis of the vast number of data feeds to understand how data flows through the organisation, how/where it is modified, where the error hotspots are, where duplication exists etc. thus enabling banks to identify where they should focus their efforts to resolve issues.
